

## **Purpose**

Hierarchical Condition Category (HCC) Coding is the risk adjustment methodology used by the Centers for Medicare and Medicaid Services (CMS) and other programs to determine the annual capitated payments for Medicare Advantage beneficiaries and to determine expected costs in Medicare Shared Savings Programs (ACOs) and newer Alternative Payment Models (APMs). Capturing HCC scores for your patients accurately reflects the severity of care to ensure appropriate funds are available for complex populations and helps your practice be more successful in APM participation or value-based models. This tool was developed to define what conditions carry a risk adjustment weight and provide common example diagnosis codes for home-based primary care. Understanding which conditions risk adjust will help your practice improve their diagnosis coding accuracy and reflect the severity of the complex patient population in which you provide care. Refer to CMS guidelines¹ for full details and requirements.

- The Centers for Medicare & Medicaid Services (CMS) uses a Hierarchical Condition Category (HCC) risk adjustment model to calculate patient risk scores to predict health care costs based on acuity and the patient's health status. Scores are used to adjust capitated payments for Medicare Advantage, determine expected costs in Medicare Shared Savings Programs (ACOs), and determine payment tiers for Alternative Payment Models (APM's).
- Total Risk Adjustment Factor (RAF) Score = Demographics + Diagnoses + Interactions + Multiple HCC's (4-10 HCC's or Chronic Conditions)
- The diagnosis examples above may be listed as unspecified only as examples since each patient's condition varies based on their own unique needs and disease progression. It's critical to code each ICD-10 diagnosis to the highest level of specificity in order to reflect an accurate risk score. Unspecified diagnosis codes should be avoided, and providers should code each active condition or health factors that impact their medical decision making or clinical judgment during visits. Assigning ICD-10 diagnoses is done at the encounter level. Every condition the patient has does not need to be present on every claim. Only assign HCC diagnosis codes when the condition is meaningfully addressed or considered, as the HCC codes reported must be supported and validated by the provider's documentation during visits.
- As a best practice when considering if the provider's documentation supports the HCC code reported, remember the MEAT acronym (Monitor, Evaluate, Assess/Address, and Treat). The provider's assessment and plan and other details included in the face-to-face progress note should support the evaluation, consideration, and/or treatment plan for the condition coded.
- CMS Risk Adjustment model details, announcements, and excel files, including a complete list of all ICD-10 diagnosis codes that carry a risk adjustment weight, can be found on CMS's Risk Adjustment Webpage: https://www.cms.gov/medicare/payment/medicare-advantage-rates-statistics/risk-adjustment (Click on the "Current Payment Year, Model Software/ ICD-10 Mappings" file for a complete listing)

### Medicare HCC Model Transition Changes 2023 - 2026

Medicare adjusts the HCC model annually. often removing or adding mapped ICD-10 codes to HCCs, adjusting RAF scores associated with HCCs, and potentially removing or adding HCCs themselves.

In 2023. Medicare started a three-year rollout plan to change the HCC structure from the 2020 model (V24) to the 2024 model (V28). The graph to the right shows the three-year rollout plan and the financial impact of each model in each year.

Staying up-to-date on Medicare HCC changes can be difficult, but the best practice is to designate someone to review any HCC changes annually to help support your practice as new information is released.

## Implementation Tips for Providers:

- Meet with your providers and clinical team to ensure they understand the impact proper ICD-10 diagnosis coding
  has on demonstrating the risk of their patient population.
- If possible, utilize your EHR (Electronic Health Record) to highlight HCC conditions.
- Implement a process to code every chronic condition and diagnosis that patients have at least once annually.
   Annual Wellness Visits (AWV) provide a great opportunity to ask your providers to update problem lists and ensure chronic conditions are coded to the highest level of specificity, capturing any complications. (e.g., Hypertensive heart and CKD with heart failure and stage 1-4 CKD; ICD-10: I13.0)
- When selecting ICD-10 codes to associate with each Evaluation and Management (E/M) encounter, report each
  condition or diagnosis that coexist at the time of treatment or affect patient management or treatment. The
  documentation should support each diagnosis that was considered during the visit.
- Ensure Assessments & Plans (A/P) clearly identify/diagnose the specific condition, reflect the status based on the providers' clinical judgment and evaluation, and have a clear treatment plan or explains why a condition was considered in their personalized care of the patient.
- Conduct ongoing internal auditing and monitoring as part of the practice compliance plan. Ensure providers receive timely feedback and education on identified areas of opportunity for improvement.
- Maintain accurate and up-to-date problem lists by reviewing during time of encounter with patient and/or caregiver.
- Do not code a condition if it does not relate to the services rendered during each encounter.
- Cross-train other team members who may be available to help prepare charts or assist providers in correct code selection.
